Chronic hyperpigmented FDE plaque

The diagram illustrates a chronic hyperpigmented FDE plaque, represented by a large, dark brown, irregularly shaped area. This plaque is divided into two main regions: a 'Lesional' region on the left, outlined by a dashed red line, and a 'Perilesional' region on the right, outlined by a dashed orange line. Within the Lesional region, there are two circular areas: one labeled 'Drug' in red text and one labeled 'Control' in red text. Within the Perilesional region, there are also two circular areas: one labeled 'Drug' in orange text and one labeled 'Control' in orange text. The 'Drug' and 'Control' labels are placed inside light gray circles with darker gray outlines. The overall background is a light beige color.
