

IDT Concentrations: Immediate vs Delayed Detection

Standard concentrations optimized for non-irritating immediate (IgE) testing

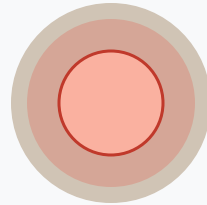

15–20 min

Immediate read

24–48 hr

Delayed read

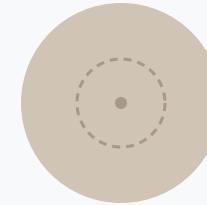

**Standard
IDT conc.**
Non-irritating
(IgE-optimized)

Wheal / flare

e.g. vancomycin via MRGPRX2

Resolves

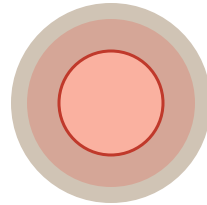

Flat — no reaction

(–)
Delayed
missed

Concentr

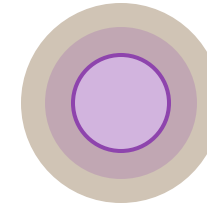

**Higher
conc.**
Needed for
delayed detection

Wheal / flare

Same MRGPRX2 response

Resolves,
then...

Indurated papule

T-cell mediated infiltration

(+)
Delayed
detected

Non-irritating
threshold

Standard IDT concentrations may miss delayed hypersensitivity —
higher concentrations needed to provoke T-cell-mediated reactions at 24–48 hr
