ERAP1 — Molecular Ruler C-terminal regulatory pocket controls length-dependent activation

✓ CLOSED (active) — peptide bridges both sites

✗ OPEN (inactive) — N-term can't reach catalytic site

ERAP2 — Internal Cavity Sequestration No C-terminal regulatory pocket; no molecular ruler

✓ ACTIVE — basic residue fits acidic S1 pocket

✗ POOR FIT — hydrophobic residue repelled by acidic S1

Hydrophobic (Leu, Phe…) Basic (Arg, Lys) C-terminal Internal
